### **A Day of Playing the Angles with CERN Data**

Students at schools in towns and cities across the globe are part of World Wide Data Day.

One big day: 12 November 2020.

One big particle accelerator: Large Hadron Collider at CERN in Geneva, Switzerland.

Fifty high schools around the world.

Thousands of protons colliding.

These are the ingredients of the data analysis and videoconferences of World Wide Data Day 2020. Students will search for particles called muons that result from proton collisions and measure angles at which they careen from the collision point. All the results will be pooled worldwide to understand the massive detectors used to capture what comes out of proton collisions and probe the nature of those collisions. Students who are part of the investigation will join videoconferences with their peers and physicists to discuss what they have learned. World Wide Data Day 2020 is an activity of International Masterclasses, QuarkNet, and the International Particle Physics Outreach Group that helps to bring particle physics to high school students and teachers through authentic data investigations.
